Figure 1 displays 12 line graphs (a-l) showing the time course of various physiological parameters during a 10-minute period. The parameters are: a) HR (beats/min), b) BP (mmHg), c) SV (ml), d) CO (l/min), e) SVR (mmHg/ml/min), f) PVR (mmHg/ml/min), g) LVEDP (mmHg), h) RVEDP (mmHg), i) LVEDV (ml), j) RVEDV (ml), k) LVEDV (ml), and l) RVEDV (ml). Each graph shows a baseline value and a response to a stimulus, with error bars indicating standard error.

The diagram illustrates the experimental setup for studying the effect of the initial concentration of the polymer solution on the morphology of the polymer blend. It shows a cross-section of a polymer blend film. The top layer is labeled 'Polymer blend' and the bottom layer is labeled 'Polymer solution'. The interface between them is labeled 'Interface'. The thickness of the polymer blend layer is indicated as 'h'. The thickness of the polymer solution layer is indicated as 'h\_0'. The diagram also shows the 'Initial concentration of the polymer solution' and the 'Initial concentration of the polymer blend'.

Figure 1 illustrates the steps of the proposed algorithm for finding a minimum spanning tree. The process starts with a graph with 10 nodes and 15 edges. The algorithm proceeds by selecting edges in increasing order of weight, ensuring that no cycles are formed and the degree of any node does not exceed 2. The steps are as follows: (a) Initial graph; (b) Select edge (1,2) with weight 1; (c) Select edge (2,3) with weight 1; (d) Select edge (3,4) with weight 1; (e) Select edge (4,5) with weight 1; (f) Select edge (5,6) with weight 1; (g) Select edge (6,7) with weight 1; (h) Select edge (7,8) with weight 1; (i) Select edge (8,9) with weight 1; (j) Select edge (9,10) with weight 1; (k) Select edge (1,3) with weight 2; (l) Final minimum spanning tree with 9 edges and total weight 9.

**Figure 1** *Diagram illustrating the experimental design. The study was conducted in a 2x2x2 factorial design. The first factor was the type of stimulus (visual or auditory), the second factor was the type of response (verbal or non-verbal), and the third factor was the type of feedback (immediate or delayed). The diagram shows the flow of the experiment, starting with the stimulus, followed by the response, and then the feedback. The feedback is provided either immediately or after a delay. The diagram also shows the different types of stimuli and responses used in the experiment.*

Figure 1. The effect of the concentration of the *Agrobacterium* suspension on the transformation efficiency of *Agrobacterium* strains. The *Agrobacterium* strains were grown in YEA medium for 24 h at 28°C. The cell concentration was adjusted to 10<sup>8</sup> cells/ml. The cells were then mixed with the plant tissue and the transformation efficiency was determined. The results are shown as the mean ± SD of three independent experiments. The transformation efficiency was significantly different from the control (p < 0.05).

Figure 1: Schematic diagram of the experimental setup. A subject is seated at a table, viewing a video screen. A camera is positioned above the screen. A target is placed on the table. A ruler is used to measure the distance from the subject's eye to the target. The distance is labeled as 100 cm. The target is labeled as 'Target'.

Figure 1 is a flowchart illustrating the experimental design. It starts with a box labeled '1000 subjects'. An arrow points down to a box labeled 'Random assignment to two groups (500 each)'. From there, an arrow points down to a box labeled 'Baseline assessment'. Another arrow points down to a box labeled 'Intervention (12 weeks)'. This is followed by an arrow pointing down to a box labeled 'Post-intervention assessment'. Finally, an arrow points down to a box labeled 'Follow-up assessment (6 months later)'.
